ER WAIT-TIME PROJECT • FINAL CONCEPT

H.A.L.O.

H.A.L.O. is a tall touchscreen tower in the middle of the ER waiting room, with a screen on all four sides. Patients can also scan a QR code to see the **same information on their phone**.

Kiosk tower

Phone view

Same info, two sizes

The tower works for anyone, including people without a phone. The phone lets patients take the information back to their seat, with their own ticket shown at the top.

How it works

1 Wait list
Every ticket number and its estimated wait. Tap one to see *why* the wait changed.

2 Hospital map
Shows you are here, restrooms, food and exits, and which areas are closed.

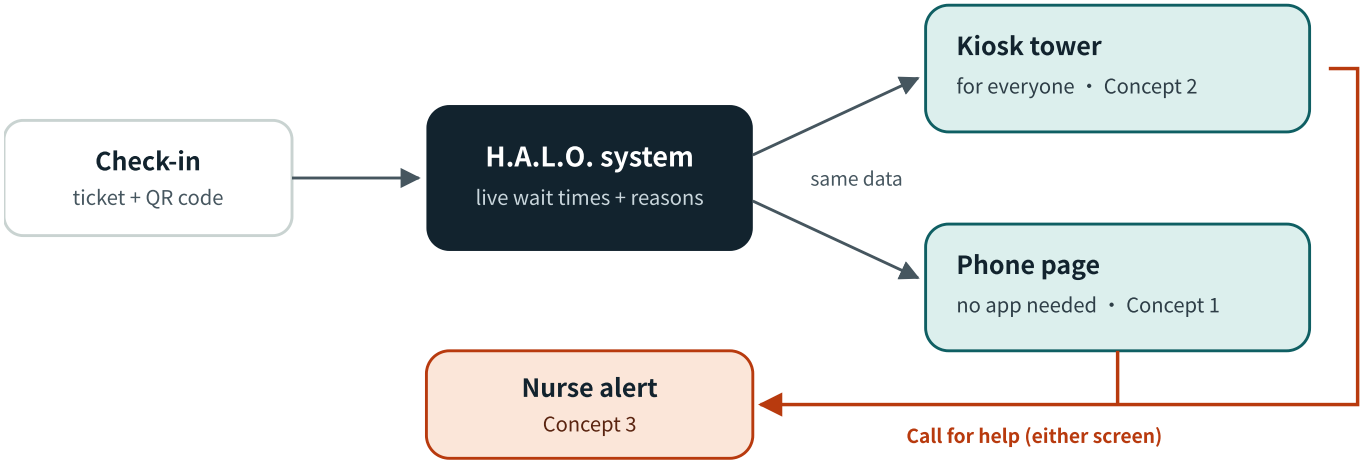

3 Call for help
Feeling worse? A nurse comes to you, and you keep your place in line.

4 Videos
Health tips and how the ER decides who is seen first.

HOW THE CONCEPTS WORK TOGETHER

One system, three ideas combined

We combined our three concepts. One live system sends the same information to the tower and to every phone. Both can call a nurse.

How our evaluation led here

	1 • QR ticket	2 • H.A.L.O. kiosk	3 • Scan from seat	Combined
Works without a phone	No	Yes	Partly	Yes
Shows your place in line	No	Yes	Yes	Yes
Call a nurse	No	Yes	Yes	Yes
Hospital map	No	Yes	No	Yes
Low cost	Yes	No	Yes	Start with one tower

Not knowing the wait causes stress. Sharing wait times raised satisfaction 18% (DePaul).	→	Live wait times on every screen
Not everyone has a phone or is comfortable with apps.	→	The kiosk tower is the core
Classmates rated H.A.L.O. best ("easy to use," "self-explanatory") but worried about cost.	→	The phone version spreads one tower further
Patients can get worse while waiting.	→	Call for help on both screens
